

### **Important Information on Sediment in your Drinking Water**

Moderate to significant sediment such as dirt, rust, and sand are present in over 40% of the international municipal water systems. Additionally, rooftop holding tanks are notorious for discharging debris directly into your bath/shower, laundry, and drinking water outlets. This sediment will compromise the quality of your water and will eventually obstruct any type of filtration system. Although our **BDC-6000BB Nanotechnology Certified Whole House Purification System** passed the stringent NSF P-231 sediment protocol, it may be necessary to use pre-filtration when sediment levels are above normal. The B. David Company has developed several pre-sediment systems that both remove heavy sediment and pro-long the filter life and reduce maintenance. **Need our assistance?** Simply send us a description of your current plumbing configuration and a current water analysis. We will then recommend an easy to install solution. Free samples may be available for testing purposes.
